

Transifex Integration

Product Documentation

OVERVIEW

Thought Industries is expanding multilingual capabilities by integrating with Transifex. By adding your Transifex API key under our integration settings, you will be able to automate and manage the translation of your learner facing interface using Transifex. It is important to note we do not offer an API integration with Transifex at this time.

In this documentation, you will find the capabilities, behaviors and guidelines for Transifex on your Thought Industries site.

TRANSIFEX INTEGRATION

Transifex is currently a premium feature and behind a feature flag. Please reach out to Thought Industries' Tech Success & Support for assistance in enabling this feature in your instance.

The first step to connecting your Transifex account with your Thought Industries site is adding your Transifex API Key.

To connect your Transifex Account:

1. Navigate to Settings > Integrations > Third Party Services.
2. Enter the API Key provided by Transifex and save.

Following this initial installation, you will be able to begin translating your site. To begin translation:

1. Visit the learner facing view of your site in a web browser.
2. Select one of your target languages using the Transifex language translation widget.
3. Continue to do this throughout the entire site, content items and pages.
4. Transifex will automatically begin to detect new content on the pages that you visit and will bring it into your Transifex dashboard for translation.

Note:

If you experience issues with your initial configuration, we recommend referencing [Transifex's Installation Documentation](#) or a member of their support team.

The use of the Transifex language selector cannot be used in tandem with features associated with Thought Industries multilingual functionality.
